

Data Project Progress Report

*An Insight Into Crash and
Weather Data in Montgomery
County*

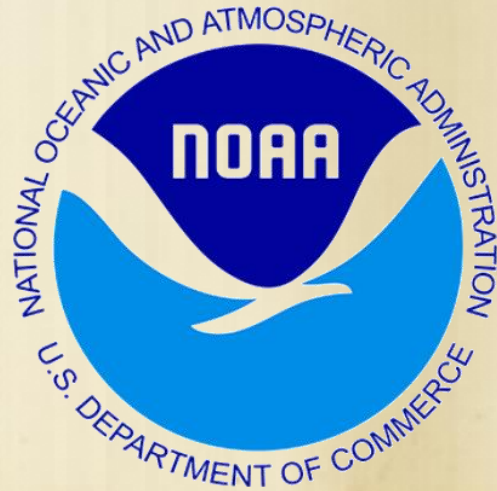

Paul Hanscom

Data

The data I am using for weather is a dataset I requested from NOAA the National Oceanic and Atmospheric Administration.

Relevant variables include:

- prcp (amount of rain)
- snowfall (amount of snow)
- total_prdp (the combination of the two above)
- Latitude
- longitude
- date.

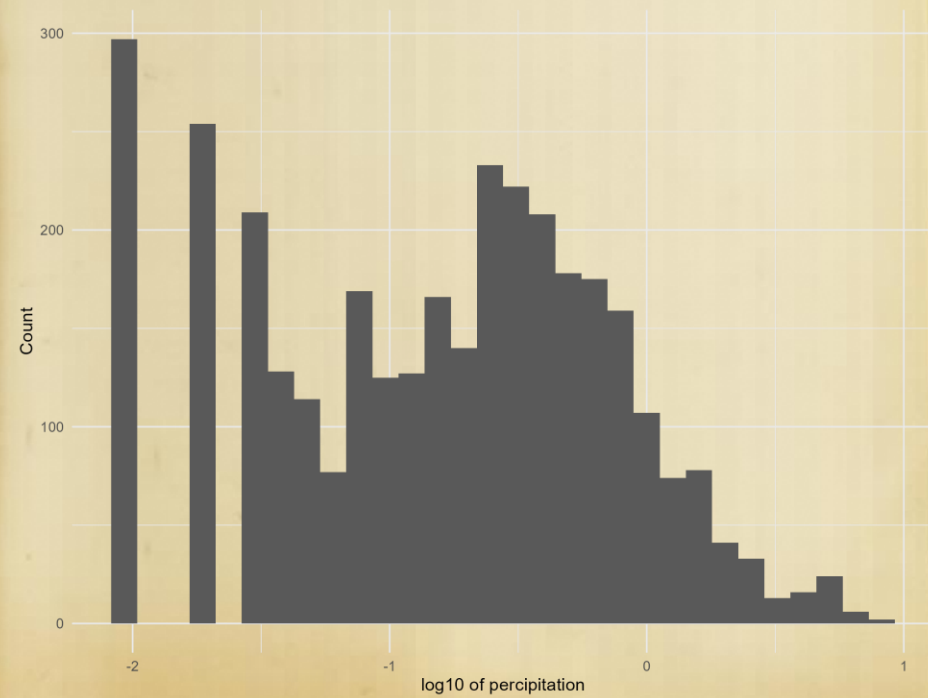

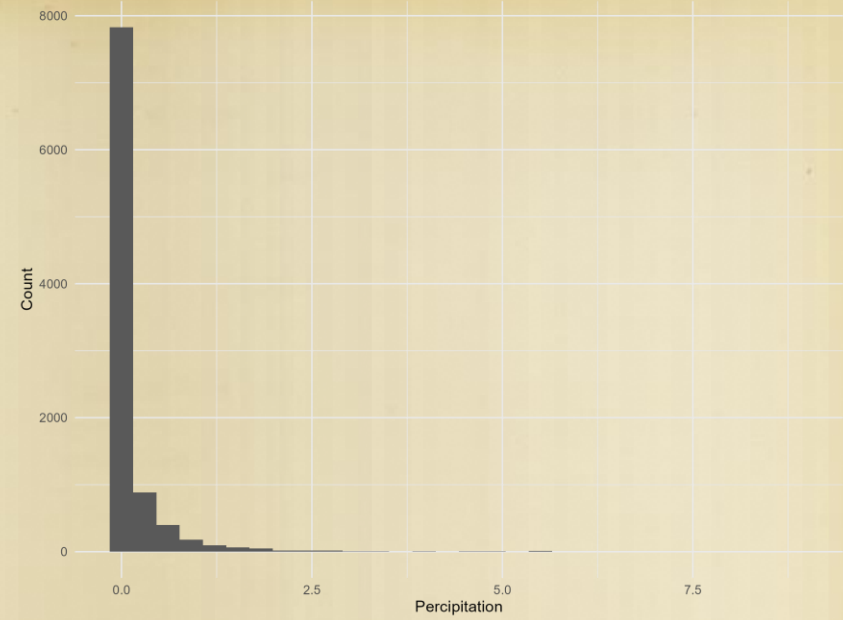

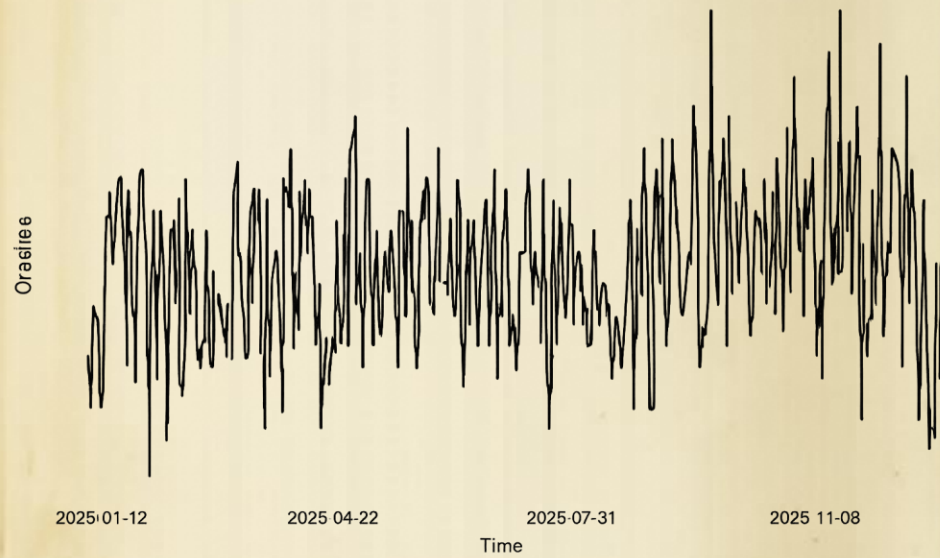

For car crash data I am using the same dataset from data Montgomery that I have talked about before.

EDA

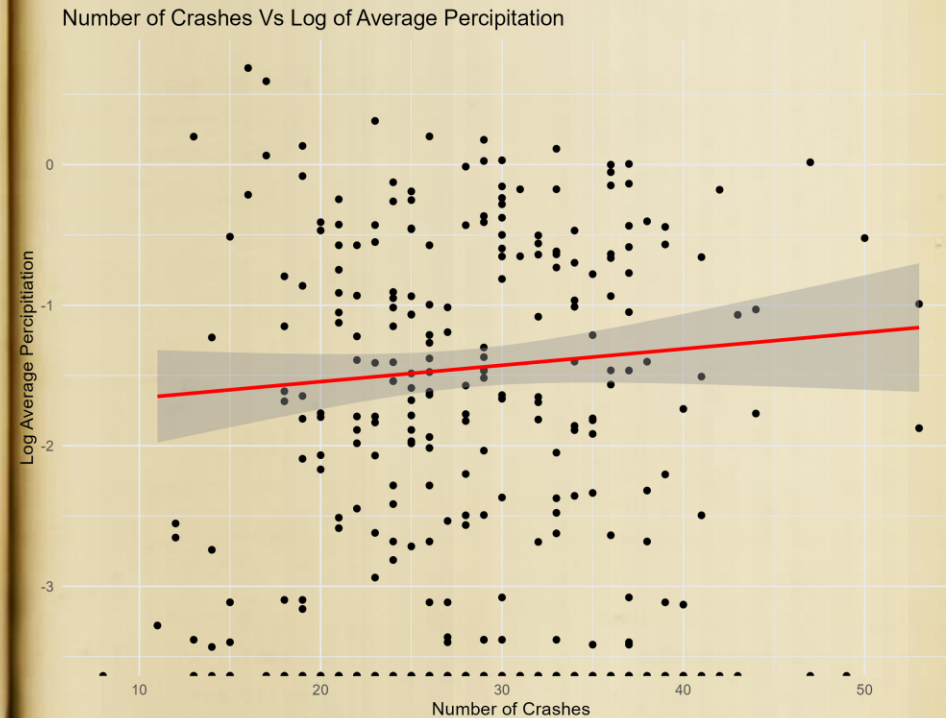

Crashes Vs Time

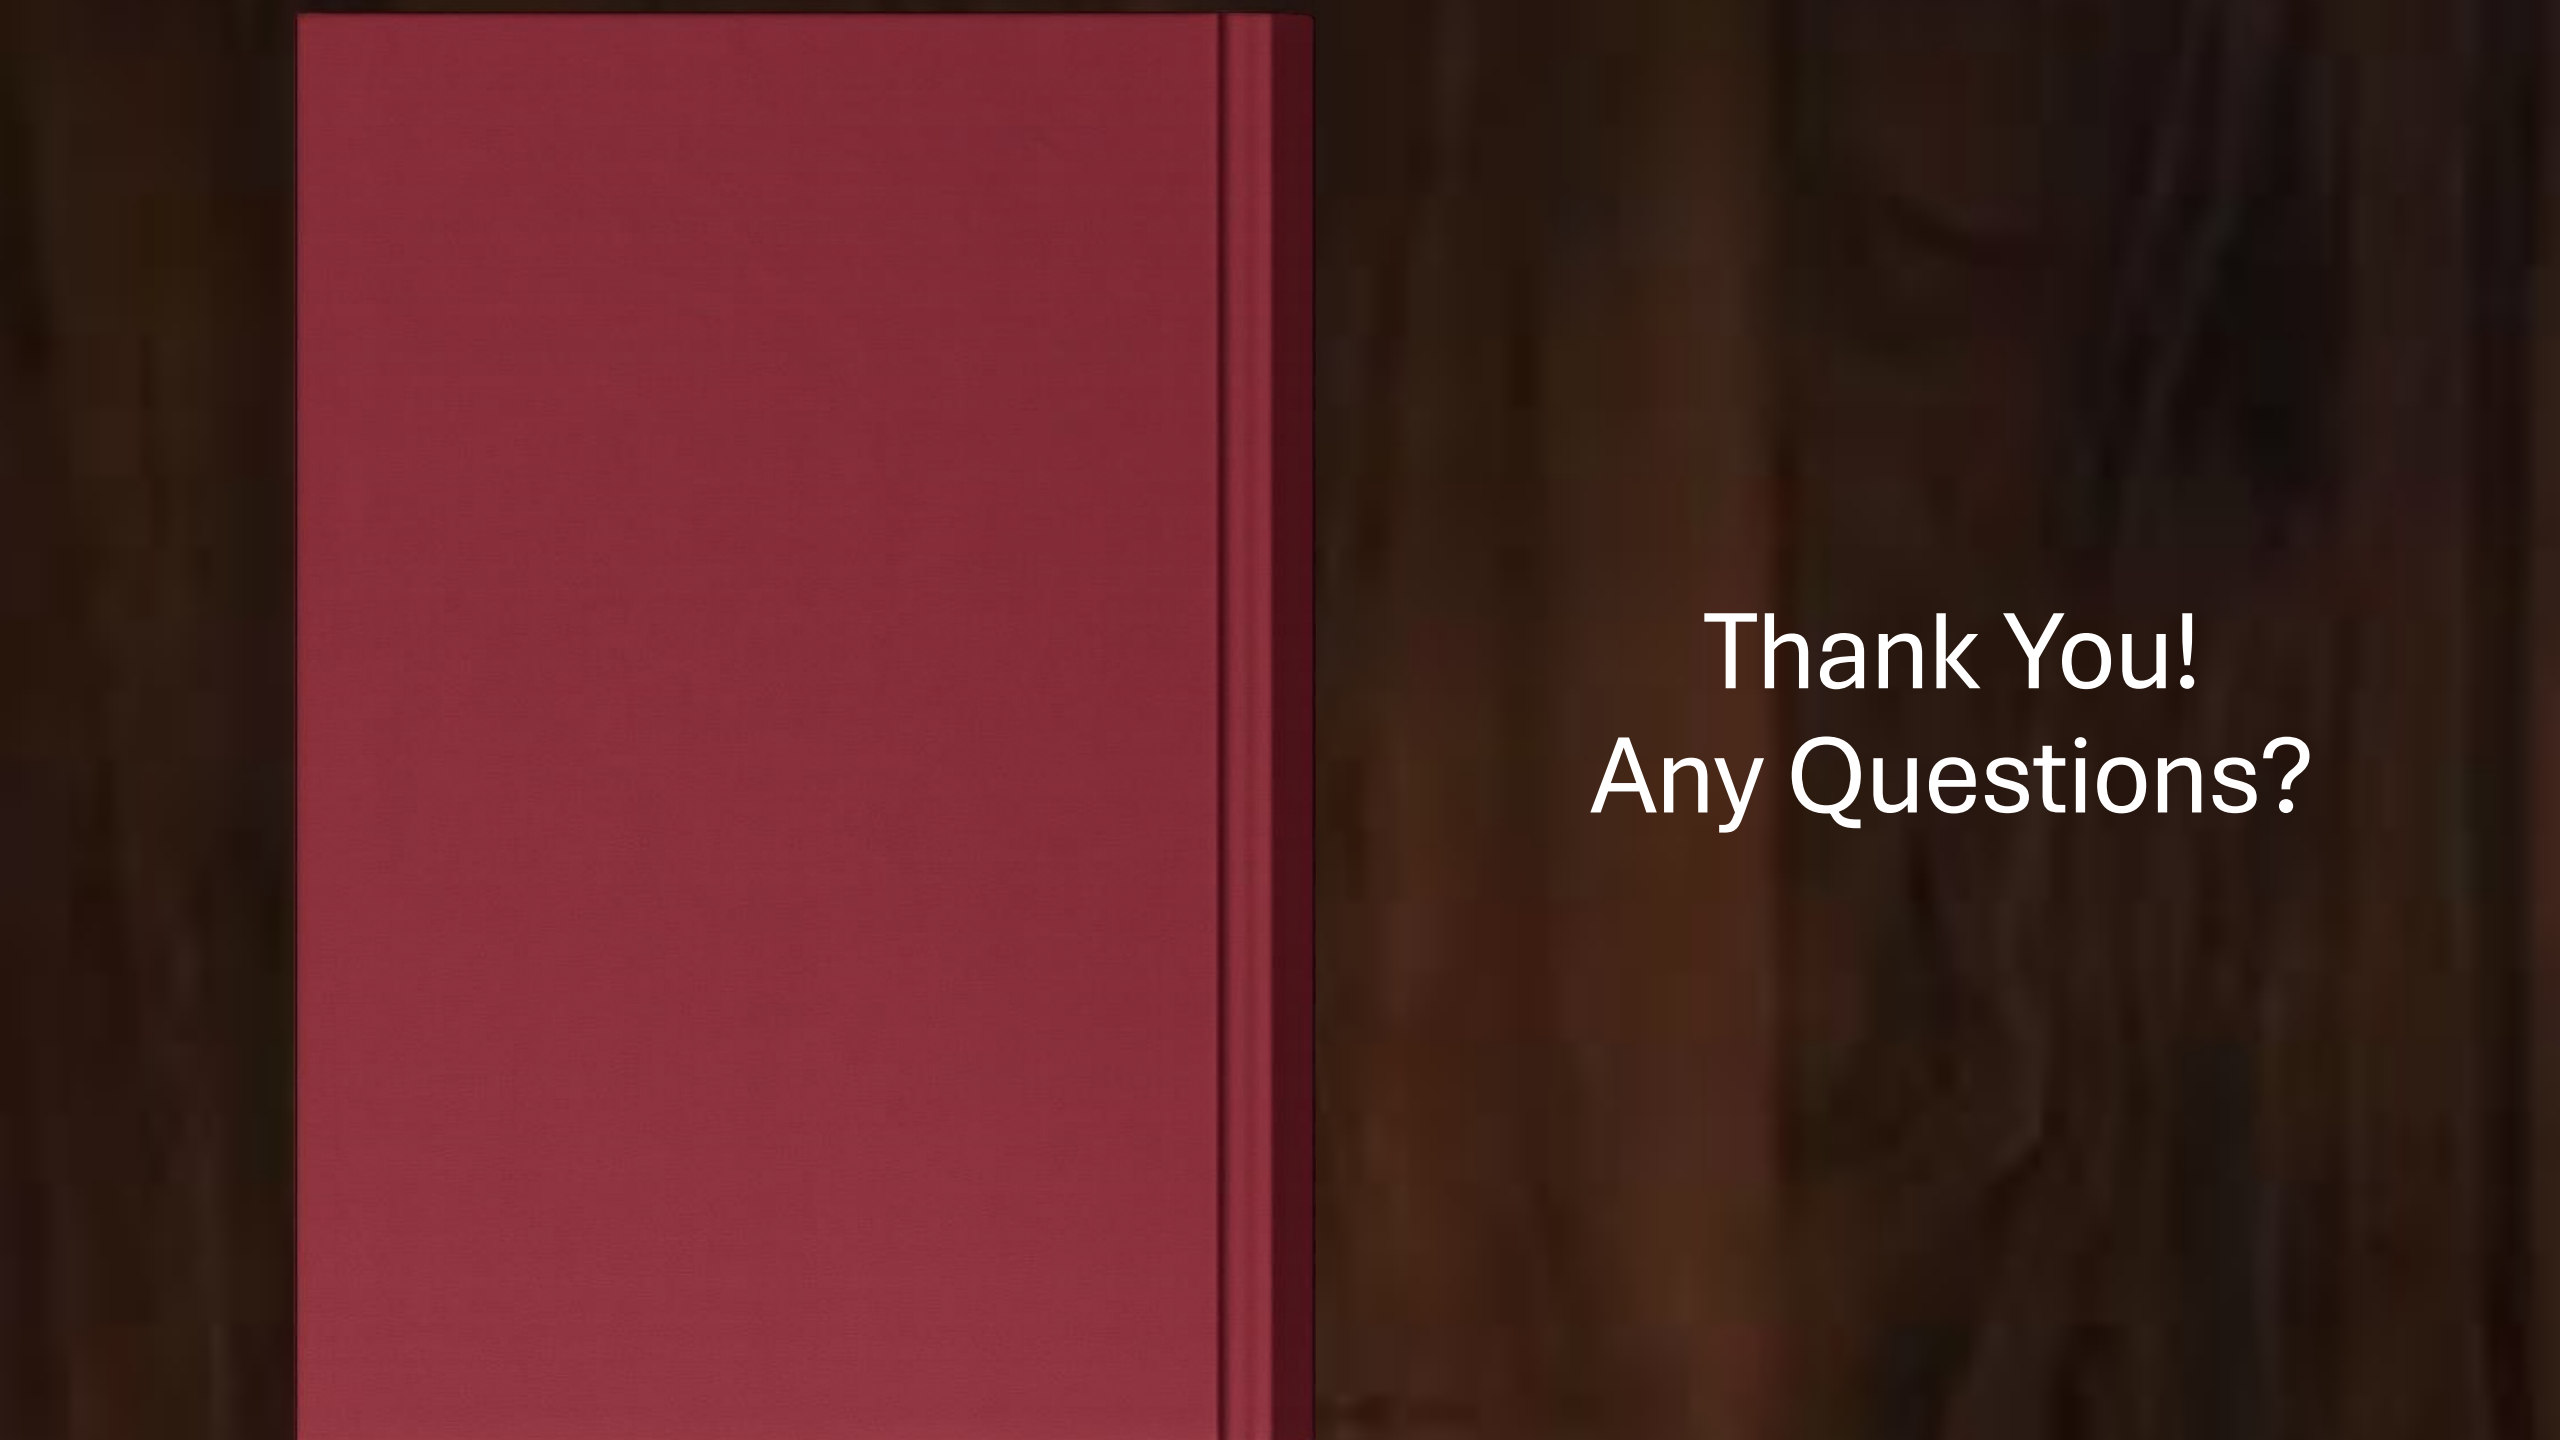

Next Steps

Moving forward:

- I need to conduct a correlation test between the number of crashes and average precipitation
- I have already done this. There is no statistically significant correlation in amount of rain on a day and number of crashes on a given day further analysis will need locational data.
- To better visualize potential trends I am full steam ahead, generating my map.
- Then I need to finalize my visualizations and create my final presentation.

Thank You!
